

## ***CROSS PLATFORM SUPPORT***

We are committed to providing fixed asset, depreciation software for the Windows operating system. However, when we discovered that the development platform we selected would also allow us to create a cross platform application that could also run on the Mac operating system, we couldn't resist.

Currently, we have been unable to find an application, like Asset Keeper, that runs on the Mac. Does that mean that no one wants it? On the contrary, we've received many calls during the last couple of years asking for a version that runs on the Mac.

### **What isn't cross platform?**

Let's be honest, when most companies say cross platform, what they really mean is that they have a version for each platform, but they don't operate, maybe even look, the same way.

There is only one thing in Asset Keeper Pro that you can only do in the Windows version and that's convert your Asset Keeper data files to the format used by Asset Keeper Pro. Why? I'm going to refer you to the How-To article named "AK vs AKPRO Data Files" for an answer to this question.

Other than that, there is no difference, other than what can be attributed to the native look in each operating system, between Asset Keeper Pro on Windows and the Mac version.

Put simply, you will be able to go from the Windows version to the Mac version and back again without changes to your Asset Keeper Pro data file or any learning curve. We spent hours ensuring that this would be the case and if you are well versed in both operating systems – as we have become – you will be extremely comfortable using either version.

### **Updates?**

Updates will be pushed out for both the Windows and Mac versions simultaneously so there will never be a case that you will experience any differences when using one version or the other due to recent updates.
